Description

Fp Cam: Software For Designing Machining Operations.

FP CAM is the office program for designing the machining operations to be performed by the machining centres. It is a general version while CAMPLUS is customized for Emmegi machining centres. FP CAM simplifies application of the machining operations, offering a 3D display the profile and the tool; it also presents the most frequently used parametric figures (holes, slots, rectangles, etc.). With the added SHAPE program, you are free to design figures of any shape. Using the DRIVER-CAD option, FP CAM lets you import pieces designed with commercial CAD 3D programs (Autodesk Inventor, SolidWorks, etc.). The machining operations designed are compatible with the FP PRO EASYMAC system and are thus assigned the necessary fittings so that, when calculating the job, it can produce a machine-ready work list.
